

Abstract

A method for manufacturing a razor blade. In the method, a razor blade blank is coined to produce a razor blade with a cutting edge. It is preferred that the razor blade blank be unhardened for coining. Additional manufacturing steps that may be performed are hardening of the razor blade at least in the vicinity of the cutting edge, and finishing the cutting edge. The method allows for the cost-effective manufacture of razor blades having both linear and non-linear cutting edges.
